SB Power to supply SoftBank base stations with renewable energy

SB Power Corp. ('SB Power'), a retail electricity business operator and subsidiary of SoftBank Corp. ('SoftBank'), will begin supplying renewable energy^{*1} to SoftBank mobile phone base stations^{*2} throughout Japan from October 2020. This will be SB Power's first electricity supply contract since acquiring "non-fossil certificates" that certify that the electricity it supplies is not derived from fossil fuels.

Base stations account for more than half of the electricity used by SoftBank, and in supplying renewable energy as a retail electricity business operator, SB Power is helping alleviate environmental impact by reducing CO2 emissions. SB Power supplies electricity from renewable sources not only to base stations, but to a wide range of customers and will continue to actively pursue business that reduces the burden on the environment by providing energy-saving services that leverage its unique AI technology.

As part of its SDGs initiatives^{*3}, SoftBank has committed to addressing climate change through technology and business by using renewable energy to reduce CO2 emissions, and has set targets for shifting the electricity used at its base stations to renewable energy (outlined in the table below).

Target date	Renewable energy target
FY 2020	At least 30% of total base station power
FY 2021	At least 50% of total base station power
FY 2022	At least 70% of total base station power

By strengthening our SDG initiatives, SB Power and SoftBank are addressing social and human issues and contributing to the realization of a sustainable society, which is the goal of the SDGs.

^{*1} Combining the electricity supplied to the base station with certified non-fossil fuel renewable energy effectively enables the supply of renewable energy

^{*2} Approx. 230,000 locations as of March 2020
